

Maddio

One App. Made to Listen.

WHAT IS Maddio ?

Maddio is a native internet radio player built from scratch for the Apple ecosystem, born out of fatigue with algorithmic playlists deciding what people should listen to. Engineered with pure SwiftUI, the application runs seamlessly across Mac, iPhone, iPad, Apple Watch (standalone), Apple TV, and CarPlay.

Built with a strict focus on system optimization, absolute privacy, and active music discovery, Maddio delivers advanced features like Live Recording, Synced Lyrics, and One-Tap Apple Music search. The app completely rejects the modern subscription model, offering a single, one-time purchase of \$9.99 with zero ads, zero tracking, and Family Sharing included.

WHY IT WAS BUILT ?

The philosophy behind Maddio is straightforward: streaming killed radio discovery. Every major platform now optimizes for a single metric—keeping users trapped inside their own loop. Their music recommendations feel safe because they are; they are engineered strictly to minimize churn, not to maximize surprise.

As the project of a solo indie developer, Maddio has no corporate boardroom to report to. There is no need to hit quarterly engagement targets or figure out how to squeeze another \$0.02 per user per month. This independence allows the focus to remain entirely on what actually matters: keeping the software small, fast, and genuinely useful.

To ensure this, Maddio operates with zero analytics. The application does not track how many times it is opened, nor does it monitor which stations are being streamed. A user's listening habits belong strictly to them.

WHAT MAKES IT DIFFERENT ?

Here's what Maddio does that they don't—or at least not in a single, lightweight package:

Live Recording : Hear something incredible on a station in Buenos Aires at midnight? Hit record. Maddio captures the raw live audio in the background without draining your battery. You'll find it in your Tracks section later. The moment is saved.

Synced Lyrics : Real-time lyrics that actually sync with what's playing. On live radio. This shouldn't work as well as it does, but it does.

One-Tap Apple Music Bridge : A curator drops a track you love? Tap the Apple Music icon. It finds the song and gets it into your library. That's it. Global radio → your personal collection in one tap.

True Cross-Device Sync. : Favorite a station on your Mac, pick up your Apple Watch on a run, and it's already there. No phone needed. Standalone watchOS app with full iCloud sync.

Tracks Section : Every song you hear gets logged automatically. Liked songs are organized separately. You'll never lose a discovery again, regardless of which device you were on.

TECHNICAL SPECS

THE NUMBERS THAT MATTER

Maddio is obsessively optimized for lightweight performance, completely eliminating modern app bloat.

App Size

Spotify is ~150 MB, TuneIn Radio is ~80 MB, and Apple Music is ~50 MB, while Maddio is just 7.8 MB. This footprint is achieved with no embedded frameworks, no bundled analytics SDKs, and no ad networks—just pure compiled Swift.

Platform	Download Size
iOS/iPadOS	7.8 MB
macOS	6.6 MB
watchOS	~3 MB
tvOS	~5 MB

CPU Usage (Measured, Not Estimated)

Maddio was profiled on a MacBook Pro with 100 samples over 10 minutes. These are real numbers:

State	CPU Usage
Idle (app open, nothing playing)	0.0 %
Playback - Median (P50)	0.7 %
Playback - P90	1.5 %
Playback - P95	2.5 %
Playback - Max (initial buffering)	~5 % (settles in 15 s)

Device fans will not spin. The battery will not drain. Through rigorous optimization, every unnecessary render cycle, layout invalidation, and CPU-burning animation was eliminated. The main thread remains 99.99% idle during playback.

Memory Usage

For a radio app that handles live streaming, metadata parsing, artwork fetching, lyrics sync, and background recording simultaneously—80 MB is remarkably lean.

Metric	Value
RAM (during playback)	~80 MB typical
System Memory %	0.4 %

Architecture

- 100% Native SwiftUI - no UIKit wrappers, no AppKit bridges (except where Apple requires it)
- Built for Apple Silicon - Universal Binary, optimized for M-series chips
- SwiftData + CloudKit - all persistence and sync handled natively, no Firebase, no third-party backend
- Local HTTP Proxy - custom stream proxy on localhost for Icecast compatibility (strips Rangeheaders that break live streams)
- Zero Third-Party Dependencies - no CocoaPods, no SPM packages, no external SDKs. Everything is first-party Apple frameworks.

Supported Platforms

Universal Purchase - buy once, run everywhere. simultaneously - 80 MB is remarkably lean.

Platform	Minimum OS
iPhone/iPad	iOS 26.0
Mac	macOS 26.0
Apple Watch	watchOS 26.0
Apple TV	tvOS 26.0
CarPlay	Full support

PRICING & AVAILABILITY

Price	9.99 USD (one time)
In-App Purchases	None
Subscriptions	None
Ads	None
Family Shairing	Included
Release Date	May 2026
Rating	4+ (no objectionable content)
Languages	English, Turkish,German, French, Italian,Spanish, Dutch
App Store	Download Maddio

ABOUT THE DEVELOPER

Maddio is built by a single indie developer. No team, no investors, no corporate backing. Just one person who loves radio, loves Apple platforms, and believes software should be fast, private, andhonest. The entire codebase—shared across all five platforms—is written and maintained by hand. Every pixel, every animation, every optimization. When you file a bug on the [Maddio Community Hub](#), you're talking directly to the person who wrote the code.

QUICK REVIEW GUIDE

If you have five minutes, here's how to see what Maddio actually does:

Step 1 - Discover Something.

Open Maddio and pick a random station. Maybe jazz from Paris.Maybe electronic from Berlin. Notice the high-res artwork and synced lyrics appearing in real-time—on live radio.

Step 2 - Bridge It.

The moment you hear something you love, tap the Apple Music icon. Watch it find the exact track and hand it to your library. Global radio → your collection, one tap.

Step 3 - Capture It.

Hit the record button while a station is playing. Minimize the app, go do something else. Come back later and find your clip in the Tracks section. That live moment is now yours.

Step 4 - Test the Ecosystem.

Favorite a couple stations on your Mac. Open your Apple Watch(no phone needed). Everything's already synced. That's iCloud doing its thing across a truly standalone watchOS app.

Step 5 - Check Activity Monitor.

This one's for the nerds. Open Activity Monitor on your Macwhile Maddio is streaming. Look at the CPU column. Then look at what your other apps are doing.The level of engineering becomes immediately apparent.
